Abstract

Recent phylogenetic studies support a monophyletic clade of New World broomrapes (*Orobanche* sects. *Gymnocaulis* and *Nothaphyllon*) sister to the Old World genus *Phelipanche*. I place the New World taxa in the genus *Aphyllon*, propose 21 new combinations, and provide a list of currently accepted taxa.

Keywords

Aphyllon, broomrape, *Gymnocaulis*, *Myzorrhiza*, *Nothaphyllon*, nomenclature, *Orobanche*, Orobanchaceae

Introduction

Phylogenetic analysis of broomrapes and related holoparasites using nuclear DNA have found that the small eastern Mediterranean genus *Diphelypaea* Nicolson is nested within *Orobanche* sensu lato (s.l.) as circumscribed by Beck (1890) (Schneeweiss et al. 2004a). Morphological and cytological differences between groups of taxa within *Orobanche* s.l. have led some botanists to adopt a narrower generic circumscription. In this taxonomic concept, *Orobanche* sensu stricto is limited to Old World species that lack bracteoles and have a base chromosome number of $x = 19$, a calyx divided to the base, and generally unbranched stems (Holub 1977, 1990). Other Old World broomrapes are treated as *Phelipanche* Pomel or the monotypic genus *Boulardia* F.W. Schultz

(syn: *O.* sect. *Trionychon* Wallr. and *O. latisquama* (F.W. Schultz) Batt., respectively; Joel 2009; Schneeweiss 2013).

Broomrape species native to the New World constitute two well-supported clades that together form a clade sister to *Phelipanche* (Schneider et al. 2016). Taxonomically, these clades have been recognized as two separate genera *Aphyllon* (= *Orobanche* sect. *Gymnocaulis* Nutt.) and *Myzorrhiza* Phil. (= *O.* sect. *Nothaphyllon* (A. Gray) Heckard) by Holub (1977, 1990) and others (Schneeweiss 2013), or more rarely, together as *Aphyllon* s.l. (Gray 1876). However, neither of these generic taxonomies has been widely adopted among American botanists, in part because of the lack of available names for many taxa. Providing evidence to support the treatment of all New World broomrapes as *Aphyllon* and a providing list of recognized species (with homotypic synonymms) is the purpose of this paper. New combinations are made where appropriate.

Methods

In order to compare molecular branch lengths of major clades of *Orobanche* s.l., a maximum likelihood (ML) phylogram of *Aphyllon* and related holoparasites was inferred from 3 nuclear DNA loci (ITS, phytochrome A, and phytochrome B). All sequences were downloaded from Genbank, aligned, and concatenated into a supermatrix using SUMAC (Freyman 2015). The ML phylogeny was estimated using RAxML (Stamatakis 2014) with a GTR+ Γ nucleotide substitution model and 1000 rapid bootstrapping replicates.

Information about type specimens, basionyms, and synonymy of these new combinations was gathered by examining protologues and images of type specimens using major databases, including Tropicos (<http://www.tropicos.org>), JSTOR Global Plants (<http://plants.jstor.org>), and the International Plant Names Index (<http://www.ipni.org>). Types for all North American taxa and *O. weberbaueri* Mattf. have been designated by previous authors and are presented here. For three of the four South American taxa, typification would require more careful efforts beyond the scope of this article. No repository is given in the protologue for two syntypes of *Orobanche tacnaensis* Mattf. (Woitschach 71 and F. J. F. Meyen s.n.). The current existence of these specimens could not be verified, although a photograph of the Woitschach 71 (possibly from a specimen at B) is available at F. No specimens are cited by Rodolfo Phillipi in the protologues of the two taxa that he described.

Discussion

Molecular phylogenetic analyses have consistently supported a sister-group relationship between two strongly supported two American clades, representing *O.* sect. *Gymnocaulis* and *O.* sect. *Nothaphyllon* (McNeal et al. 2013; Schneider et al. 2016; Fig. 1). This relationship is supported by biogeography and synapomorphies such as a calyx with five fully developed lobes and a base chromosome number of $x = 12$, with polyploidy in most
